

VICTOR ADEIZA

Full-Stack & AI Systems Engineer · Multi-Agent Orchestration & Web3 Infrastructure

+234 916 383 6950 · <mailto:vicdevmanx@gmail.com> · vicdevman.dev · github.com/vicdevman · linkedin.com/in/vicdevman ·

Remote · UTC+1 (Nigeria)

SUMMARY

Full-stack engineer specializing in AI agent infrastructure and Web3 systems. I design and ship autonomous multi-agent pipelines (LangGraph, CrewAI, Python), production LLM orchestration, and on-chain automation, from architecture through deployment. My edge is the rare intersection of applied agentic AI and blockchain tooling: I've shipped multi-agent networks that coordinate independently, conversational systems that translate natural language into structured on-chain transactions, and trading agents with ensemble-model decision layers, all running in production.

TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript

AI & Agents: LangGraph, LangChain, Multi-Agent System Orchestration, RAG Pipelines, LLM Integration (OpenAI, Anthropic, Gemini), Vector DBs (Supabase/pgvector)

Backend: FastAPI, Node.js, Express, WebSockets, REST APIs, Socket.io

Frontend: React, Next.js, Tailwind CSS, Framer Motion

Databases: MongoDB, PostgreSQL, Prisma

Web3: Ethers.js, Solana, Base, EVM, Web3.js, Account Abstraction (Metamask, Privy), EVM smart contract interaction, on-chain data pipelines

Infrastructure: Docker, VPS, PM2, Nginx, CI/CD; familiar with AWS & GCP

Integrations: Telegram Bot API, Discord API, Kraken CLI

PROFESSIONAL EXPERIENCE

Frontend Lead / Full-Stack Engineer · Guru Innovation Hub

Jan 2025 – Present

AI-powered flood detection platform · National hackathon placement

- Led a team of 5 engineers, owning technical architecture decisions and sprint delivery from design to production.
- Built modular, real-time frontend systems in React, integrated with Node.js and FastAPI backends for live data processing.
- Integrated AI models and data pipelines into a flood detection platform, system presented to 100+ users; achieved 3rd place nationally.
- Established CI/CD practices and deployment standards across the team, reducing release friction and improving shipping cadence.

Freelance Full-Stack AI Engineer · Independent

2022 – Present

AI automation · Multi-agent systems · Web3 tooling · Telegram/Discord bots

- Designed and shipped AI-powered automation tools including autonomous multi-agent workflows, RAG-based systems, and LLM-integrated products for clients.
- Built production blockchain tools including wallet analytics platforms and on-chain trading systems across EVM and Solana ecosystems.
- Deployed full-stack applications on VPS infrastructure (PM2 + Nginx), managing everything from architecture to uptime.
- Integrated Telegram bots and mini apps as user-facing interfaces for Web3 products, enabling real-time alerts and monetization flows.

KEY PROJECTS – [See More](#)

[ShipStory - Autonomous Multi-Agent Growth Engine](#) | Python, WebSockets, MongoDB, Next.js, AIML API

- Engineered an autonomous network of 6 isolated Python agents communicating via WebSockets (Band SDK) to translate raw git commits into changelogs, newsletter drafts, and social media campaigns.

- Developed an adversarial validation loop utilizing a Product Manager agent to grade engineering impacts, intercept IP leaks, and audit copywriting compliance before publishing.
- Integrated Flux 2 Pro (AIML API) and Cloudinary for automated media asset generation, feeding directly into a Next.js visualization dashboard.

Qleva - Conversational Crypto Automation Engine - Current / *LangGraph, Node.js, Account Abstraction, MongoDB*

- Built an AI assistant using a LangGraph state machine (TypeScript/Node.js) to resolve natural language commands (e.g. DCA, scheduled bridges) into structured, simulated transaction plans.
- Constructed a Nodejs agent backend for intent-gathering, missing-field detection, gas simulation, and spending-limit enforcement.
- Integrated Privy smart wallets and Metamask Smart Account & Delegation toolkit for non-custodial execution of recurring, user-approved wallet routines.

Aegis AI - Autonomous Trading Agent & Telemetry / *TypeScript, Node.js, Express, MongoDB, Socket.io, Kraken API, Sepolia ERC-8004*

- Designed a trustless autonomous trading engine featuring a 3-model ensemble quorum (Claude, GPT-4o, Gemini) with a 0.65 confidence gate that abstains on disagreement to eliminate hallucinated trades.
- Implemented regime-classified strategy selection (trend, mean reversion, breakout, carry) with ATR-based position sizing and a 5% daily drawdown kill-switch.
- Logged all trade decisions on-chain via ERC-8004 on Sepolia testnet for full verifiability; built a live Socket.io telemetry pipeline streaming readable agent decisions to a monitoring dashboard.
- Delivered as a full monorepo (Turborepo + pnpm) with MongoDB state persistence enabling automated crash recovery. Submitted to lablab.ai AI Trading Agents Hackathon (April 2026) — Agent ID #48.

WhaleSight - Solana Wallet Analytics Platform / *TypeScript, React, Node.js, Solana Web3.js, Telegram Bot API*

- Built a high-performance Solana whale wallet tracker with real-time PnL analytics derived from swap activity across multiple DEXs.
- Delivered a user-facing interface via Telegram bot and mini app, enabling users to follow high-performing wallets and receive live alerts.
- Designed the analytics pipeline to handle concurrent wallet tracking with low-latency updates using a WebSocket-based architecture.

EDUCATION

Bachelor of Science, Computer Software Engineering

University of Cross River - (Expected 2028)

Pursuing a formal CS foundation alongside active production work. Coursework spans software engineering principles, data structures, and systems design.

AVAILABILITY & WORK PREFERENCES

Open to remote-first full-time roles, contract-to-hire, and project-based engagements. Available immediately. UTC+1, flexible to overlap any timezone. Fluent in English. Best fit: AI-forward startups building agentic systems, Web3 infrastructure teams, and SaaS companies embedding intelligent automation.
